

Apply filters to SQL queries

Project description

The purpose of this project is to use SQL queries to examine the organization's data in their employees and log_in_attempts tables and to investigate potential security issues.

Retrieve after hours failed login attempts

It was discovered that potential security incident occurred after business hours after 18:00 therefore we will need to query all of the log_in_attempts data in the table and review the activity. To get the data of login attempts after 18:00 i have used this SQL query:

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE login_time > '18:00' AND success = FALSE;
```

The SQL queries use commands such as SELECT FROM where the SELECT value will specify the column and the FROM will specify the specific table. In this case we needed to also filter the dates and time and to do that we had to use operators such as the WHERE which specified a specific part of the column and also by operators such as AND OR NOT and comparison operators such as = > < .

Screenshot showing the output:

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE login_time > '18:00' AND success = FALSE;
```

```

The suspicious event occurred on 2022-05-09 and I have to retrieve all of the login attempts which occurred on this day and the day before. To do that I use SQL query:

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
```

Screenshot showing the output:

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
```

The SQL queries use commands such as SELECT FROM where the SELECT value will specify the column and the FROM will specify the specific table. In this case we needed to also filter the dates and time and to do that we had to use operators such as

the WHERE which specified a specific part of the column and also by operators such as AND OR NOT and comparison operators such as = > < .

Retrieve login attempts outside of Mexico

We know that the log-ins happened outside of Mexico therefore we only need to retrieve the attempts for countries which are not in MEXICO. To do that I have used the SQL query :

```
SELECT *  
->  
-> FROM log_in_attempts  
->  
-> WHERE NOT country LIKE 'MEX%';
```

The NOT country in the query means that it will look for columns where the specified country is not present. LIKE tells the query which country to look for. I have used the value MEX% as the MEXICO country can be imputed as MEX or MEXICO. The operator % means that it will look for any data in the country column which starts with MEX therefore it will cover MEXICO as well.

The screenshot showing output:

```
MariaDB [organization]> SELECT *
->
-> FROM log_in_attempts
->
-> WHERE NOT country LIKE 'MEX%';
```

Retrieve employees in Marketing

Another task is to check all of the login details from the Marketing team for all of the employees who work in the East part of the building. To do that I have used SQL query :

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Marketing' AND office LIKE 'East%';
```

The query asks to check the department column where the data matches Marketing and then also check the column Office where data is like East. I used the % operator after East to look for any data starting with Eeast to represent the east part of the building.

Screenshot showing the output:

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Marketing' AND office LIKE 'East%';
```

Retrieve employees in Finance or Sales

Task is to retrieve the employees in Finance or Sales. The query I used:

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Finance' OR department = 'Sales';
```

I used an OR operator to specify that we need employees' data from Finance and also from Sales.

The output screenshot:

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Finance' OR department = 'Sales';
```

Retrieve all employees not in IT

Task is to retrieve all employees who do not work in the IT department. Query used:

```
MariaDB [organization]> SELECT * FROM employees WHERE NOT department = 'Information Technology';
```

The NOT operator before department means that the query will look for all data except for the specified Information technology department.

Screenshot of output:

```
MariaDB [organization]> SELECT * FROM employees WHERE NOT department = 'Information Technology';
```

Summary

The activities above used SQL query systems to find specific data in the relational database. Use of SQL and terminal specifically enables users to fetch and manipulate data much faster than using GUI based environments.
